

New Ezi-Tilt

Maintaining Street Lights

Easy as changing a light globe? No way! Maintenance of street lighting assets can be a daunting and costly exercise.

The Problem:

Most private developments or retirement villages have roads which are narrow with many curves, roundabouts and driveways making accessibility to the streetlight difficult.

Thus, turning a simple thing such as changing a light globe into a major logistics exercise often involving expensive equipment such as a scissor lift.

The Solution:

Ezi-Tilt was specifically developed to address these frustrations. The design is a result of extensive consultation with the retirement market including village managers, developers and design consultants.

Ezi-Tilt provides a simpler and safer way of maintaining your street lighting assets.

Design Features

- Serviceability. Ezi-Tilt is simple to operate and allows for manual lowering and lifting of the column by one operator to enable quick globe changeover and serviceability of luminaire.
- Pole Height is kept to 4m or less in order to address two specific areas. Firstly to allow operation by one person when servicing the pole (the higher the pole the heavier it is) and luminaire. Secondly, a common problem is the amount of spill light that encroaches into private properties. Keeping the pole height to a minimum substantially reduces spill light.
- Cleaning of pole/luminaire. Made easy, as the pole is laid at a comfortable level.
- Ease of installation. Ezi-Tilt can easily be installed as a standard rag bolt mounted pole or on Vicpole's "Ezi-Fit" sleeve system.
- Upgrade to Ezi-Tilt. Ezi-Tilt can be retrofitted onto existing concrete/bolt foundations for an easy upgrade.
